

TEXTILE PRINTERS

AT FESPA 2017

COMPARATIVE CHART AND STATISTICS

Maria Renée Ayau

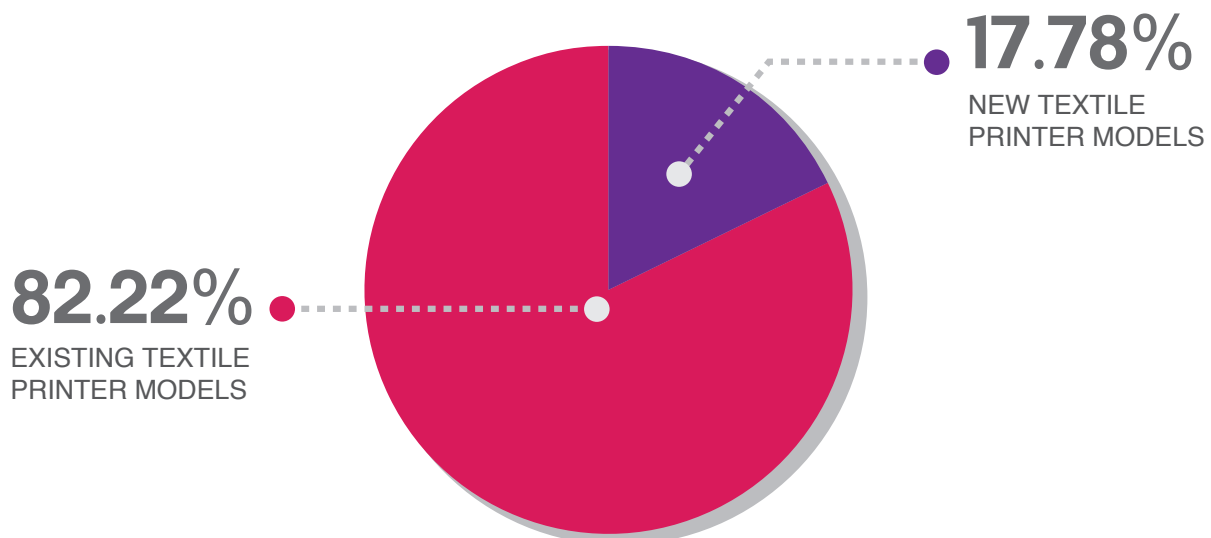

INTRODUCTION

FLAAR Reports has been studying wide-format textile printers for over a decade, the continuous and steady growth in the market has driven us to expand more into textile printing. Now we are also focusing on textile inkjet inks, fabrics, transfer paper, and finishing equipment; so we can provide a full workflow for textile.

At FESPA Hamburg 2017, I was able to gather data from the wide-format textile printers there, so here is a comparative chart: brand, model, booth where they were exhibited, printing method, printing mechanism, and printhead.

This report also includes graphs with statistics and comparisons with all this information, so you can have a more clear idea of what are the TRENDS in this market at FESPA 2017.

* durst claims to manufacture their own printheads, but actually it is the array, it is the electronics that durst makes. The actual "printheads" they buy the components from Fujifilm Dimatix (tend to be used for UV-curing printers) and Ricoh (tend to select Ricoh Gen5 for textile printers), and with that create their own version of the printheads themselves. But until we get further confirmation, we do not include Durst in the Ricoh statistics (but you can add that to the stats in your mind).
